

# Exp 6: Automating Business Processes using Deluge Scripting and Workflows, with Application Testing and Debugging

---

## 1. Aim

---

To design and configure an automated business process workflow within the Zoho Creator application using form-level workflow automation and declarative notification actions, and to successfully conduct application testing and live debugging to verify real-time email notification execution upon record submission in the `Service_Request_Form` Report.

## 2. Procedure

---

### Step 1: Access Workflow Builder and Initialize Workflow Trigger

In the Zoho Creator Application Builder for **Vehicle Services & Repair Request**, navigated to the **Workflow** tab in the top navigation bar. Clicked **New Workflow** to launch the workflow trigger configuration palette ("*Run workflow on any event in the form*") and specified the following trigger parameters:

- **Choose form:** `Service_Request_Form` Report
- **Run when a record is (Record Event):** Created
- **When to trigger workflow (Form Event):** Successful form submission
- **Name the workflow:** Send registration email

Clicked the blue **Create Workflow** button to generate the workflow pipeline.

### Step 2: Add New Action via Notification Panel

Inside the visual Workflow Builder canvas under the trigger block (`Service_Request_Form` Report > Created > Successful form submission > Send registration email), clicked + **Add New Action**. From the available action categories (*Notification, Data access, Integrations, and Deluge script*), selected the **Notification** tab ("*Notify through email, SMS. Redirect to URL*"). Under the **Select an action** menu:

- Send email
- Send SMS
- Send notification
- Show success message
- Redirect to a URL

Selected **Send email** to open the email configuration drawer.

### Step 3: Configure Email Notification Parameters and Message Template

Configured the email dispatch settings within the **Send email** action panel:

- **From\*:** Configured as `notifications@pravinraj.me` (with the platform deliverability notice: *"To improve deliverability, emails will be sent through our domain if unauthenticated or public domain is used. Learn more"*).
- **To\*:** Dynamically mapped to the customer email field tag `${Email_Address}` via the field picker so that each notification routes directly to the submitter.
- **Bcc:** Configured administrative delivery tracking by adding `contact@pravinraj.me` (with options to *Add Cc, Add Reply-to, or Remove Bcc*).
- **Subject:** Entered Record Added.
- **Message:** Formatted the message body using the rich-text editor (Font: DeJaVuSans, Size: 10) and embedded dynamic system parameters:  
`${zoho.loginuserid}` has added a record in form Service\_Request\_Form Report
- **Advanced Options:** Checked **Include user submitted data** and set appropriate **Content type** to format data payloads.

Clicked **Save** to persist the notification action.

#### Step 4: Inspect Visual Workflow Logic and Finalize

Reviewed the visual workflow diagram rendered on the canvas. The trigger block connects directly to the execution condition block marked **Execute without condition** containing the action tile **Send mail to \${Email\_Address}**. Clicked **Done** in the top header to finalize and register the workflow.

#### Step 5: Verify Active Workflow Status in Application Management Dashboard

Navigated to the Zoho Creator application dashboard under the **Workflow** tab > **Form workflows** sub-tab. In the left navigation list under **Forms with workflows**, selected `Service_Request_Form Report` and verified that the newly created workflow appears in the workflow directory with the following verified attributes:

- **Workflow Name:** Send registration email
- **Event Group:** Created > Successful form submission
- **Details:** 1 Action
- **Status:** Enabled (toggle switch active/green)
- **Created On:** 06-Oct-2026

#### Step 6: Live Application Testing and End-to-End Verification

Accessed the published live user interface of the `Vehicle Services & Repair Request` application, navigated to the service request form, and submitted a test record with customer details and a valid email address. Monitored delivery logs and checked the recipient Gmail inbox to confirm end-to-end execution without delay.

### 3. Output

#### 3.1 Workflow Trigger Configuration — Defining Form Event Properties

The initial workflow setup modal demonstrates the target form selection, record creation event trigger, and workflow naming.

The screenshot displays the 'Run workflow on any event in the form' configuration window in Zoho Creator. The interface includes a 'Back' button in the top left and a close button in the top right. The main configuration area contains the following fields and options:

- Choose form:** A dropdown menu with 'Service\_Request\_Form Report' selected.
- Run when a record is (Record Event):** Radio button options for 'Created' (selected), 'Edited', 'Created or Edited', and 'Deleted'.
- When to trigger workflow (Form Event):** A dropdown menu with 'Successful form submission' selected.
- Name the workflow:** A text input field containing 'Send registration email'.
- Create Workflow:** A blue button to save the configuration.

The bottom of the window features a navigation bar with 'My Pins', 'Charts', and 'Contacts' tabs. On the right side of the bar, it shows 'Trial expires in 14 days', an 'Upgrade' button, and links for 'Get started faster!', 'Help', and a trash icon.

### 3.2 Action Category Palette — Selecting "Notification > Send email"

The action selection interface displays the four available action categories, highlighting the Notification suite and the Send email option.

Figure 2: Action Selection Panel — Choosing "Notification > Send email" Action Type

### 3.3 Email Notification Editor — Configuring Delivery Headers & Template

The Send email drawer showing Sender (From), dynamic recipient ({Email\_Address}), Bcc address, Subject line, and rich text body template with dynamic Zoho tags.

Figure 3: Notification Configuration Drawer — Customizing "Send email" Parameters and Message Body

### 3.4 Visual Workflow Canvas — Finalized "Execute without condition" Block

The visual workflow pipeline canvas showing the active action card configured to dispatch mail to \${Email\_Address} without preconditions.

Figure 4: Visual Workflow Canvas — Configured Action Block ("Execute without condition > Send mail to \${Email\_Address}")

### 3.5 Application Workflow Directory — Active "Send registration email" Workflow

The Form workflows dashboard confirming that the "Send registration email" workflow is registered, configured with 1 Action, and set to Enabled status.

Figure 5: Zoho Creator Workflow Dashboard — Active and Enabled "Send registration email" Workflow Entry

### 3.6 Target Email Inbox — Delivered Live Automated Confirmation Message

The Gmail inbox confirming real-time receipt of the automated confirmation email with Subject "Record Added" sent from notifications@trial.zohocreatormail.com.

Figure 6: Live Customer Email Inbox (Gmail) — Delivered Automated Notification Message ("Record Added")

## 4. Result / Observations

The automated business process workflow was successfully designed, configured, and tested in Zoho Creator:

1. A form-level automated workflow trigger was established on the **Service\_Request\_Form Report** to listen for **Created > Successful form submission** events.
2. A declarative **Notification** action (**Send email**) was configured with dynamic recipient binding (`${Email_Address}`), audit routing via Bcc (`contact@pravinraj.me`), and dynamic template variable resolution (`${zoho.loginuserid}`).
3. The workflow was verified as active and enabled within the Zoho Creator application workflow management console.
4. Live application execution successfully triggered instant email routing and verified delivery to the target email inbox from `notifications@trial.zohocreatormail.com` with the subject "**Record Added**".
